Company

JPS Composite Materials is the world's leading manufacturer of high strength fiberglass, Astroquartz®, aramid, carbon, and specialty reinforcement fabrics.

Our materials are used extensively in composite reinforcing, insulating, and safety applications. JPS fabrics are used in consumer and industrial electronics, aerospace interior and exterior structures, advanced commercial and military radomes, in marine and surf applications, sporting goods, and other advanced composites, and as ballistic protection.

Our materials are readily adaptable to unlimited applications!

Conditions of Sales

All sales of JPS products are subject to the terms and conditions of JPS' standard confirmation of order.

All statements herein are expressions of opinion which the Seller believes to be true and correct. Seller expressly disclaims liability for factual accuracy of such opinions and hereby advises Buyer to investigate each situation on an individual basis before taking action based on Seller's expression of opinion.

Statements concerning possible use of our products are not intended as recommendations for their use in the infringement of any patent. No patent warranty of any kind, expressed or implied, is made or intended.

For further information, write to
JPS Composite Materials

PLEASE NOTE: Because of the many variables associated with producing industrial reinforcement fabrics (yarn type, fabric construction, widths, finishes and other facts), the technical data and other information contained on these pages are intended as a general guide only. The data contained herein is subject to change at the Seller's discretion without notification unless specifically prohibited by specific purchase specifications.

Parameters for Fabric Selection

- 3 In selecting a woven fabric for industrial applications a number of design parameters must be considered. These are broken down into five basic variables: Yarn Weight, Yarn Thickness, Yarn Count, Weave Pattern, and Fabric Finish.

Yarn weight and yarn count determine the majority of the physical properties of the fabric. Yarn count is defined as the number of warp yarn ends (lengthwise) and filling yarn picks (widthwise) used per inch.

The weave pattern determines the stiffness or drapability of the fabric. The pattern will also have an influence on overall thickness. For composite applications there are six basic patterns: Plain, Basket, Leno, Four Harness Satin (Crowfoot), Eight Harness Satin, and Twill.

The fabric finish is the surface chemistry applied to the fabric post weaving. Finishes are generally applied to promote adhesion between the fabric and any resin coatings. They may also serve to add stiffness, prevent moisture uptake, and wear damage caused by handling.

Glass Yarn

Yarn determines the majority of the end fabric properties, including the fabric weight, thickness, and strength.

The yarn properties are determined by the chemical composition, the number of input filaments per yarn strand, the number of yarn strands twisted or plied together, and the overall denier (weight) of the final input yarn.

Glass Formulations

Glass fibers are made from different formulations: "E" is the most common all-purpose glass. Other types include "S", "T", and "L", among others. Astroquartz® products are the purest form of silica commercially available.

COMPOSITION OF TYPICAL GLASSES

(%) by weight

Ingredient	"E" Glass	"S", "T" Glass	"Astroquartz ® II & III"
Silicon Dioxide	52-60	64-66	99.99
Calcium Oxide	16-25	-	-
Aluminum Oxide	12-16	24-26	-
Boron Oxide	8-13	-	-
Sodium and			
Potassium Oxide	0-1	-	-
Magnesium Oxide	0-6	9-11	-

4

Filament/Yarn Nomenclature

An exact system for identifying fiberglass textile yarns is required because of the wide variety of available types. The nomenclature consists of two basic parts. The alphabetical portion describes the composition and construction. The numerical describes the weight and number of yarns twisted and plied together.

As an example:

Glass Composition	Filament Diameter	Number of Single Strands in Continuous Filament Yarns
E=Electrical		
S=High Strength		
 	 	
Type of Yarn	Strand Count	Number of Strands Plied Together
C=Continuous Filament	Yardage/Lb (in Hundreds)	

The above describes the basic strand by composition, type and diameter. The numbers identify strand weight and construction. The above description would be for ECG 150 1/2 yarn, or more simply G-150 1/2, used in style 1581 fabric. The S-glass version for style 6581 fabric would be SCG 150 1/2, where "S" denotes S-glass. The non-twisted equivalent for 7781 would be ECDE 75 1/0.

The strand count is the first series of numbers following the letters. It indicates approximate yardage per pound, in hundreds. The number of yards in one pound of single yarn strand can be found by multiplying the strand count by 100.

5

The second series of numbers designates the number of plies in continuous filament yarns. The first digit in the second digit series indicates the number of single strands twisted together. Untwisted single strands are commonly referred to as "singles" yarn and are designated as 1/0.

The second digit in the second series, separated from the first digit by a diagonal line, designates the number of strands that are plied together. To find the total number of strands in a yarn, multiply the two numbers (0 multiplied as 1). A typical nomenclature for a continuous yarn:

ECG 150-1/2 Where:

E = E-glass

C = Continuous filament

G = Average filament diameter (see table, page 6)

150 = 15,000 Yd/Lb (Nominal) of basic "singles" strand

1/2 = One continuous filament yarn strand consisting of two strands plied together (1X2)

The approximate yards per pound of fabricated yarn can be found by dividing the strand count, multiplied by 100, by the number of strands.

Therefore, ECG 150 1/2 contains:

$$\frac{150 \times 100}{1 \times 2} = 7500 \text{ yds/lb for fabricated yarn}$$

The results of this computation must always be considered approximate, as yards per pound may be reduced slightly in the twisting and plying operations.

DESCRIPTION OF CONTINUOUS FILAMENT GLASS FIBERS

Filament Name	Filament Diameter mils	Diameter microns	Strand Count (x100=yd/lb)	Tex	Number of Filaments
B	0.15	3.8	150	33	1224
C	0.15	3.8	150	33	816
D	0.23	5.0	1800	2.75	51

			37	134	408
			25	198	608
			18	275	816

DESIGN CONSIDERATIONS FOR GLASS FABRIC SELECTION

There are five basic design variables to consider when choosing fabric for industrial use: thickness, aerial weight, yarn size, construction, finish.

Thickness

Glass fabrics are available in thicknesses ranging from ~0.001" to ~0.060".

Weight

Fabric weights are typically measured in ounces per square yard (osy) or grams per square meter (gsm). Glass fabrics are available from about 0.50 osy up to about 52 osy (17 gsm to 1773 gsm.)

7

Construction

Construction refers to the fabric pattern, which is both the number of warp yarns per inch (machine direction, ends) and fill yarns per inch (cross-machine direction, picks), and the pattern of interlacing used (plain, twill, satin, etc).

Yarn Size (denier or weight)

Fabric weight and thickness are determined by the input yarn size (denier or weight).

Finish

The finish is the chemical composition of the surface of final fabric. Organic coatings are applied (or removed) to make the fabric more suitable for future resin coating and end use performance requirements.

FABRIC CREATION

Yarn Preparation: Twisting/Plying

This process serves to control the yarn strength, diameter, weight, and flexibility.

Filaments are twisted and or plied based on the end fabric specification requirements.

Most glass fabrics are woven from singles yarns (1/0). Some notable exceptions including styles 108, 120, and 1581.

Warping

Warping is the laying of the machine direction fibers in parallel order. This creates the warp, or machine direction, lof the fabric.

A specified number of yarns per inch are drawn from a

creel and wound on a warp beam. Several “section” beams are then combined to provide the designated number of yarns per inch required in the fabric specification.

Slashing/Combining

The section beams from warping are combined during the slashing process to create a warp beam (aka: loom beam). This entire system of parallel threads is wound onto one large beam to become the “warp”, or machine direction, of the fabric.

An additional yarn binder is applied to the warp yarns during the slashing process. The additional binder helps to improve fabric surface quality by providing extra protection to the warp yarns during the weaving process.

Entering

The entering operation draws the warp yarns into to the loom, setting up the weave pattern, yarn spacing and thread counts. The warp yarns are threaded through the harnesses and reed. The entire warp beam-harness-reed unit is then transferred to the loom to begin weaving.

Weaving

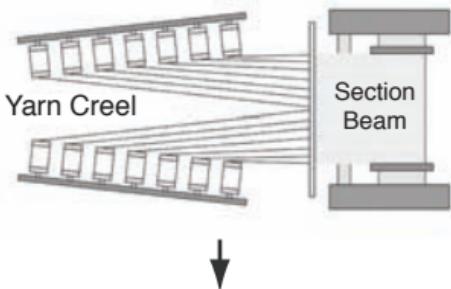

Weaving is the interlacing of filling (cross machine) yarns through warp (machine direction) yarns in a predetermined pattern, including yarn counts, yarn spacings, over/under sequences and predetermined intersecting angles.

Cleaning and Finishing

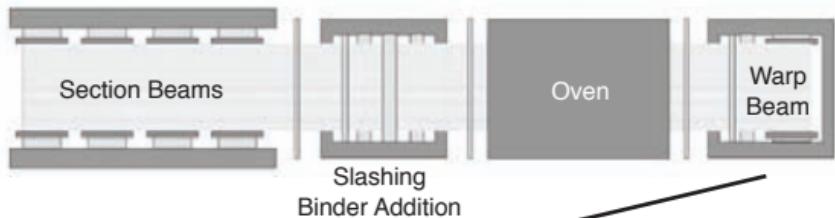

Dependent on the end fabric use, specialty chemical finishes may be applied to the fabric surface. The loom state (greige) fabric surface must first be cleaned. This is accomplished via either heat exposure or chemical washing. Most glass fabrics are ‘heat cleaned’, most polymer based and specialty fabrics are chemically scoured. The specialty finish is applied post cleaning.

Manufacturing Process Overview

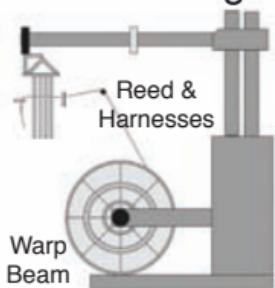

1. Yarn Prep and Warping

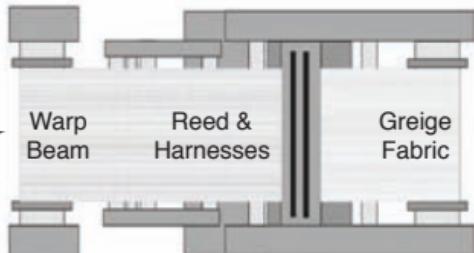

2. Slashing/Combining

3. Entering

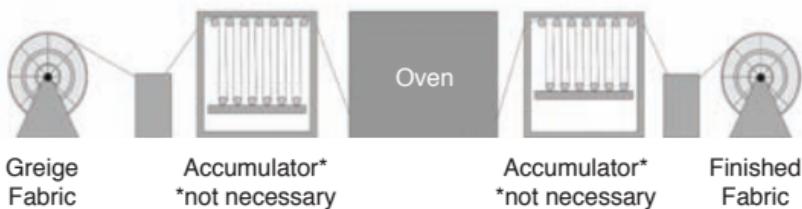

4. Weaving

5. Heat Cleaning/Chemical Scouring

6. Finishing

Finishes most commonly act as coupling agents to improve resin wet-out and bonding. Finishes may also be applied to improve water and wear resistance, high temperature performance..

JPS offers a wide range of existing finishes. We do develop specialty and exclusive finishes based on customer input. For more information please contact us.

Weave Patterns

The matching of yarn, weave pattern and finish for a particular application is an exacting science. Because glass, carbon, aramid and specialty fabrics are highly engineered, the right combination of fabric weight, thickness and construction is essential in selecting the proper fabric. Selecting the right reinforcement fabric for any requirement can be simplified by calling us. Our specialized experience can aid in selecting a reinforcement fabric suited to your requirements.

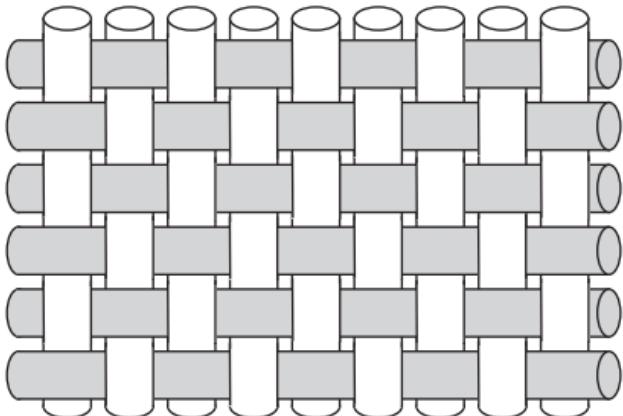

All standard of fabric weaves presented here can be produced with fiberglass, aramid, Astroquartz ®, polymer, specialty and carbon yarns.

The six most common fabric patterns are presented here. Other fabric patterns are available on request; as well as through development.

Plain Weave fabrics tend to be the most stable pattern, followed by Leno, Basket Weave, 4H Satin, 8H Satin fabrics.

In terms of drape or conformability, 8H Satin is the most conformable, followed by the 4H Satin, Basket Weave, Plain Weave and Leno fabrics.

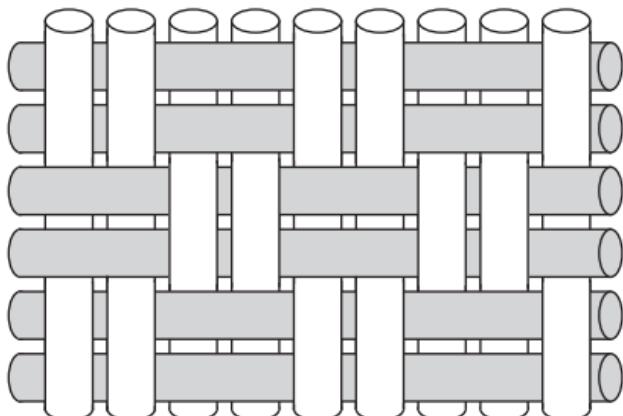

Plain Weave

11

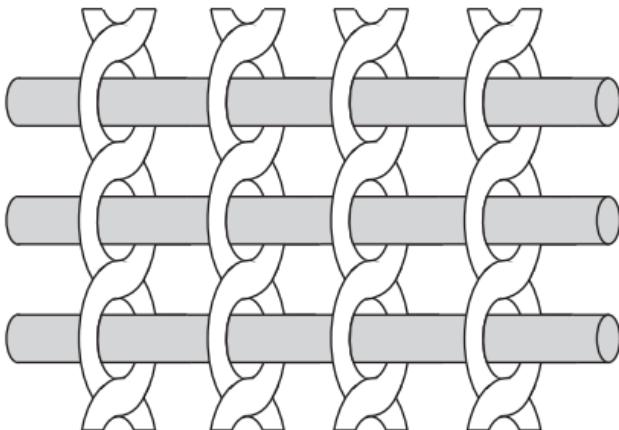

The plain weave consists of yarns interlaced in an alternating pattern, one over and one under every other yarn. The plain weave provides good fabric stability. It is the primary fabric used in the electronics and coating industries.

Basket Weave

The basket weave is similar to the plain weave, except that two or more filling yarns are alternately interlaced over and under one another. The basket weave is more pliable, flatter, and stronger than the plain weave, but is not as stable as a plain weave.

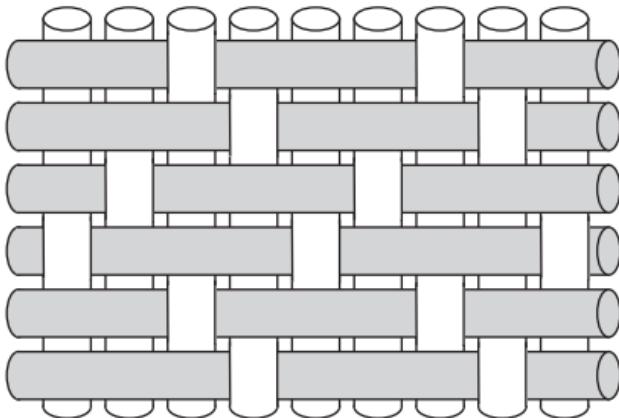

Leno

12

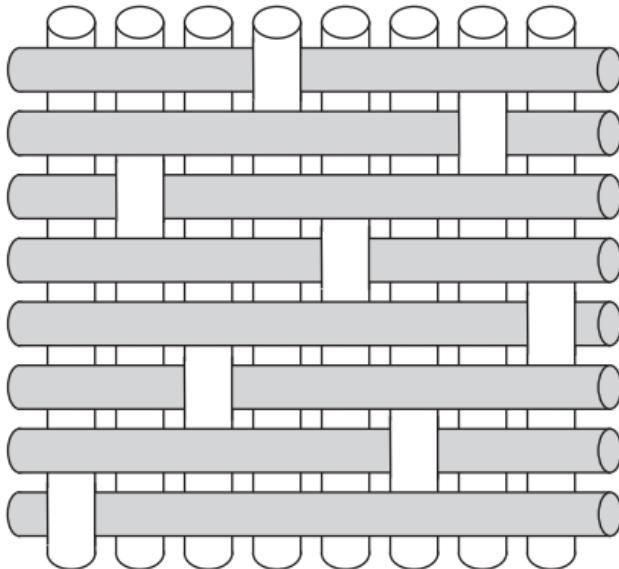

The leno weave is used where relatively low aerial weights are desired but specific thicknesses must be maintained. The leno weave pattern locks the yarns in place by crossing two or more warp threads over each other and interlacing with one or more fill threads. Leno weave patterns are common in EIFS applications and to set bond line thicknesses for adhesives and tapes.

Four-Harness Satin (Crowfoot)

The four-harness satin relies on a three by one interlacing, pattern. The fill yarn floats over three warp yarns and under one. The four-harness satin weave is more pliable than the plain weave and is easier to conform to curved surfaces typical in reinforced plastics.

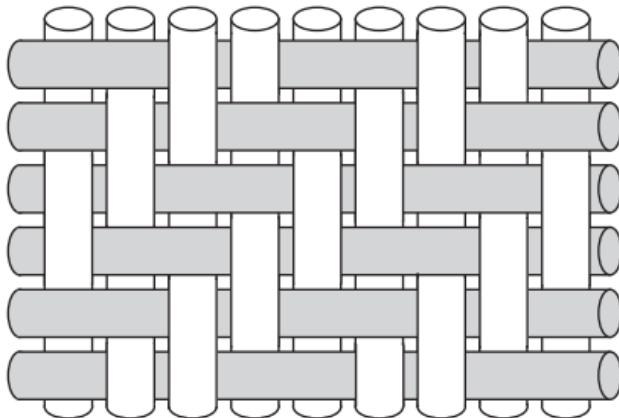

Eight-Harness Satin

13

The eight-harness satin is similar to the four-harness satin except than one filling yarn floats over seven warp yarns and under one. This is a very pliable weave and is used for forming curved surfaces.

2x2 Twill

The twill is used where tightly woven fabric with high density is required. The twill weave is characterized by a diagonal rib or twill line. The warp yarn floats over two consecutive picks, permitting more yarns per unit area.

Specifications and Standards

JPS fabrics are designed to meet the requirements of a wide range of applications. Listed below is a partial offering of the standards and specifications we manufacture towards. For adherence to a specific standard or specification not listed please contact customer service or technical support.

Fiberglass Fabric Applications

Fiberglass fabrics are used in a wide range of industrial applications, some of which are outlined below.

Aerospace Applications

Fiberglass is used for interior cabin structures including seats, luggage bins, bulkheads, lavatories, wall panels, and in honeycomb structures. Other applications include gasketing, as galvanic barriers between carbon and metal, for structural parts, and in support of radomes. JPS is BMS, AMS, SAE and MIL spec approved for your needs.

17

Electrical Applications

Fiberglass fabrics can be found in printed circuit boards, antennas, high voltage generators, transformers, switches, cables and many other electrical applications.

Structural Applications

Fiberglass fabrics are used as reinforcements in highly engineered composite materials in many of the world's leading aircraft, automobiles, buildings, and roadways,

Recreational Applications

JPS fiberglass is found in many recreational composites, including in high performance racecars and motorcycles, bicycles, bats, racquets, hockey sticks, and in high end surf and snow boards.

Thermal Insulation

The U.S. Navy, commercial shipyards, the automotive, and aerospace industries all use fiberglass almost exclusively for pipe lagging, thermal pad cover, thermal protection, and insulation applications.

General Industrial Applications

Fiberglass fabrics can be found in window shades, vapor barriers, movie screens, packaging tapes, awnings, protective clothing, gaskets, conveyor belts, food cooking applications, and countless other products that improve our lives daily.

Fiberglass Fabric Finishes

Fiberglass fabrics are available with a variety of finishes and treatments. The most common finishes are listed here, for specific applications, or to develop a custom finish for your application please contact customer service or your technical support representative.

Finish Name	Functionality:			Notes
	Primary	Secondary		
Greige	Uncoated	Phenolic	Loom state fabric with yarn binders	
Caramelized (210)	Uncoated	PTFE	Loom state fabric, partially volatized

ASTROQUARTZ ® PRODUCTS

Astroquartz ® is a registered trademark of JPS Industries

JPS has been weaving the 99.99% pure silica fabric since 1964. Astroquartz ® is used in many of the world's most advanced composite applications. This includes usage in the manned and unmanned space programs, as stealth supporting materials, as radomes for superior signal integrity, and internet connectivity on commercial airliners.

Astroquartz ® is the leader when it comes to low dielectric, high strength, and high thermal reliability composite reinforcements.

37

Astroquartz II ® & Astroquartz III ® Properties

Astroquartz ®, Astroquartz II ® and Astroquartz III ® are composed of identical raw materials. Astroquartz ® has been discontinued in favor of Astroquartz II ® and Astroquartz III ®. Improved manufacturing and handling technologies have allowed Astroquartz II ® and Astroquartz III ® to become more robust and cost effective. All represent unparalleled quality, purity, and performance. JPS and Astroquartz ® innovation gives new flexibility to your design opportunities.

Properties of Astroquartz ® Fibers

Tensile Strength -

Virgin Single Filament.....6.0 GPa (870 ksi)

Tensile Strength - Impregnated Strand on 20 End Roving
(ASTM D-2343).....3.6 GPa (530 ksi)

Young's Modulus.....72 GPa (10 msi)

Poisson's Ratio.....0.16

Density.....2.2 g/cm³

Silica Content (exclusive of yarn binder).....99.99%

Fiber Diameter - Astroquartz II ®.....9µm

Fiber Diameter - Astroquartz III ®.....14µm

Physical Properties of Fused Quartz

Mechanical Properties

Density.....	2.2 g/cm ³ or 0.79 lb/m ³
Hardness (Mohs Scale).....	7

Electrical Properties

Dielectric Constant (Dk) - 1 MHz.....	3.70
Dielectric Constant (Dk) - 10 GHz.....	3.74
Dissipation Factor (Df) - 1 MHz.....	0.0001
Dissipation Factor (Df) - 10 GHz.....	0.0002

Thermal Properties

Linear Expansion Coefficient.....	0.54 x 10 ⁻⁶
Specific Heat @ 20°C (J/gK).....	7.5 x 10 ²
Thermal Conductivity (W/mK).....	1.38
Strain Point (Log ₁₀ n = 14.6).....	1070°C (1958°F)
Annealing Point (Log ₁₀ n = 13).....	1220°C (2084°F)
Softening Point (Log ₁₀ n = 7.6).....	1700°C (3092°F)

Note: n = Viscosity in Poise

38

Optical Properties

Refractive Index @ 15°C.....	1.4585
Dispersion.....	67
Field of Transparency (μm).....	0.2 to 4.0

Astroquartz® Applications and Design Considerations

Astroquartz® fabrics offer better solutions when high strength, low dielectric loss and high heat resistance is required.

The aerospace industry relies on Astroquartz® fiber products made from pure fused silica (99.99% SiO₂) to produce an outstanding, reproducible reinforcement material.

There are five basic design variables to consider when choosing Astroquartz® fabrics:

Astroquartz ® Applications and Design Considerations (cont.)

Thickness

Quartz and composite fabrics are available in thicknesses ranging from 0.003" to 0.027" (0.13-0.69 mm).

Weight

The weight for Astroquartz ® fabrics range from 2.0 to 19.5 ounces per square inch (128 to 660 gsm).

Construction

Construction is the number of warp and fill yarns per inch (machine and cross-machine direction) and the fabric pattern. This helps determine the thickness, weight, drapability, and overall performance of the fabric.

Yarn Size

39 Yarn size is a major factor in determining the weight and thickness of the fabric. The yarn size, twist and ply counts will also play a large role in determining the overall strength of the woven fabric. For specific applications, one yarn may be selected over another to the advantage of the performance characteristics.

Finish

The Astroquartz ® fabrics can be coated with a coupling agent, called the finish, to assist resin wet out and to improve the strength of the fiber to resin interface. This has the effect of improving the mechanical, thermal and electrical performance characteristics of the final part. Please contact JPS technical or customer service for assistance in choosing the correct fabric finish for your application.

Astroquartz® II & III Fabric Finishes

A partial list of the available finishes is presented, for additional finishes or to develop an application specific finish, please contact JPS.

Finish Name	Functionality:		Notes
	Primary	Secondary	
S-928	Epoxy		Epoxy functional silane
1059 HT/ 2059 HT/ 3059 HT	Polyimide	Thermo-plastic matrices	Formulated for high temperature and moisture resistance
9779	Epoxy	Bismaleimide Cynate Ester	Amino-silane
9827/ 2827/ 3827	Epoxy	Polyimide, Bismaleimide	Recommended for electronic and aerospace applications
9836/ 2836/ 3836	Epoxy	Bismaleimide	Scoured fabric to remove most organic binder components
9837/ 2837/ 3837	Polyester	Vinyl Ester Epoxy, Cynate Ester	Recommended for resins cured by vinyl addition

Astroquartz II ® Chopped Fiber

Astroquartz II ® chopped fiber is made by cutting continuous filaments of high purity, extremely fine quartz to a predetermined length. Fiber composition is 99.99% SiO₂(silica) exclusive of binder.

Astroquartz II ® chopped fibers are widely used in reinforced plastics, molding compounds and ceramic composites. The chopped fibers add thermal resistance and improved ablation to the final part.

Type 556 Chopped Fiber

Fiber Lengths*
from 1/8" to 1"

Astroquartz II ® chopped fiber with an aminosilane binder. Compatible with epoxy, phenolic and some polyimide resins.

* Due to the nature of the cutting process, cut lengths may vary slightly.

41

Standard Packaging

1 lb packages packed loosely in clear polyethylene bags.

Order Requirements and Lead Times

Please contact JPS to confirm availability and lead time.

Dependent on available inventory the minimum order requirement is approximately 60 lbs. Please allow 8-12 weeks for processing.

Astroquartz® II & III Fabrics

The physical properties listed are for greige (untreated) fabrics. Actual values may vary. For additional information, please contact a Technical Service Representative, (864) 224-3506. Note: AQ II fabrics are woven with 9779 resin compatible binder. AQ III are available only as finished fabrics.

Astroquartz ® Mat Style No. 550

Specifications

Length.....	1000 mm (39.37 in)
Width.....	500 mm (19.69 in)
Area.....	0.5 m ² per sheet (5.38 ft ²)
Thickness.....	5 mm (0.2 in)
Weight.....	78 g/m ³ (2.3 oz/yd ³)
Density.....	0.016 g/cm (1 lb/ft - approx.)

Handling

Astroquartz ® s/550 mat is impregnated with a polyvinyl alcohol binder in the manufacturing operation. This provides a stable mat which can be handled, cut, or fabricated to exact dimensions and can be installed with ease. The binder can be removed by heating to 900°F for 1 hour, or at 500°F for 24 hours. Binder content on the Astroquartz mat is between 4% and 5% by weight. Cut sheets of approximately 500 mm x 500 mm (20 in x 20 in) are also available with an area of approximately 2.8 ft² per sheet.

43

Astroquartz ® II Roving

Astroquartz II ® roving is made from continuous filaments of pure fused silica nine microns in diameter. Fiber composition is 99.99% SiO₂ (silica) exclusive of binder. Standard 20 end roving equivalent to 20 ends of 150 1/0 contains 4800 nine micron diameter filaments. The fiber density is 2.2 g/cm³. Astroquartz II ® roving has a fiber tensile strength of 0.5 MSI*

Property Data**

------------------	---------

Astroquartz II ® Sewing Thread

Astroquartz II ® sewing thread is made from high purity, extremely fine, continuous filaments of pure fused silica; capable of extended exposure to 2000°F. Fiber composition is 99.99% SiO₂ (silica) exclusive of binder.

Astroquartz II ® sewing threads are supplied coated with PTFE.

44

With 9855 Teflon Coating (20±4%)

** ±10%

Standard Packaging

Astroquartz II ® sewing thread are typically available in 0.5 kg spools. Please contact JPS for price and delivery lead times.

Astroquartz ® Yarn

Astroquartz ® yarn is made from extremely fine continuous filaments of 99.99% pure fused silica, exclusive of binder, capable of extended heat exposure to 2000°F.

Astroquartz ® yarn has more than five times the yarn yield of high silica leached yarn. This results in higher tensile strength and abrasion resistance. With Astroquartz ® high production efficiencies are possible in the production of high temperature flexible insulation.

Astroquartz ® yarn is widely used in the form of braided insulation for thermocouple wire, coaxial cables, space separators, hoop wire, and heating elements

Property Data

Type	Approx. Diameter (in)	Approx. Breaking ε (lb)*	Approx. Yield (yd/lb)
300 2/0	0.008	3	15000
300 2/2	0.012	6	7500
300 2/4	0.018	10	3750
300 2/8	0.020	24	1875

*Test Method - ASTM D-578

45

Astroquartz ® yarns are available with an amino-silane binder system, compatible with phenolic, epoxy, and some polyimide resins. Heavier or lighter count yarns can also be manufactured. Please consult JPS for price and delivery.

Standard Packaging

Yarns are available on standard milk bottle packages for plied yarns and double flanged packages for twisted single yarn. Net yarn weights range from a minimum of 1 lb/pkg to a maximum of 2.5 lb/pkg.

Fiber Characteristics

Astroquartz II ®*

- Number of Filaments
- 300 1/0 - 120 filaments
- 300 2/0 - 240 filaments
- 300 2/2 - 480 filaments

Astroquartz III ®**

- 125 1/0 - 120 filaments
- 125 2/0 - 240 filaments

* Astroquartz II ® filaments are 9 μm in diameter, similar to an ECG filament
* Each filament is 9 μm in diameter, equivalent to an ECK filament.

Physical Properties of Para-Aramid

Para-Aramid - Kevlar ®*, Twaron ®**

Physical Properties

Density.....	1.44 g/cc
Equilibrium Moisture Level, Kevlar 29.....	4.5%
Equilibrium Moisture Level, Kevlar 49.....	3.5%

Mechanical Properties

UTS (room temp).....	2.9-3.0 GPa
Elongation at Break.....	2.4-3.6%
Young's Modulus.....	71-112 GPa
Shear Modulus.....	26-41 GPa
Poisson's Ratio.....	0.36

Thermal Properties

Shrinkage in Water at 212°F (100°C).....	<0.1%
Shrinkage in Dry Air at 351°F (177°C).....	<0.1%
Specific Heat Capacity at 77°F (25°C).....	1.420 kJ/kg-K
Specific Heat Capacity at 212°F (100°C).....	2.01 kJ/kg-K
Specific Heat Capacity at 356°F (180°C).....	2.52 kJ/kg-K
Thermal Conductivity.....	0.04 W/m-K
Decomposition Temperature in Air.....	800-900°C
Recommended Max Temperature Range for Long Term Use in air.....	149-177°C
Heat of Combustion.....	35x10^6 J/kg

Advanced Materials Applications

Ballistics and Protection Products

JPS manufactures high performance fabrics for use in ballistic resistant applications. High performance fabrics are used extensively in bullet, fragment, and stab resistant body armor for militaries, federal agencies, police, and correctional departments. They are also used in the manufacture of helmets for both military and civilian agencies.

Aerospace and Recreational Composites

JPS high performance fabrics are used in a variety of composite applications. Aramids and other high performance fabrics are designed to maximize strength, weight savings, durability, and cost. Applications include aerospace, kayaks, recreational sporting goods, and safety equipment, among others.

Advanced Fabrics Nomenclature

High performance fibers are typically designated by denier, tex, or decitex (dtex). Each is described below.

Denier

The denier system is used internationally to measure the size of textile filaments and yarns. Denier number indicates the weight in grams of 9,000 meters of filament or filament yarn. For example, if 9,000 meters weighs 100 grams, it is a 100-denier yarn. The smaller the denier number, the finer the yarn.

$$\text{Denier} = \text{dtex} \times 0.9$$

Tex and Decitex

The tex system is also applicable to the measurement of filament yarns. It is based on the weight in grams of one kilometer (3,300 feet) of yarn. Decitex (dtex) is defined as ten times tex.

$$\text{Tex} = \text{dtex}/10$$

Finishes for Advanced Materials

A partial list of the available finishes is presented, for additional finishes or to develop an application specific finish, please contact JPS.

Finish Name	Description
CS-811	Loom state fabric
CS-800	Scoured aramid fabrics
CS-802	Scoured UHMWPE fabrics
CS-892	Water repellent finish for Spectra and Dyneema fabrics
CS-898	Traditional water repellent finish for Kevlar fabrics
CS-899	Traditional water repellent finish for Twaron fabrics
CS-6000	Engineered aramid water repellent treatment for improved performance
LCS	Laminated Composite Substrate
ML	Micro-Laminate
WRT	Water Repellent Treated

Engineered Aramid Fabrics

These unique fabrics are engineered using the synergy from a combination of specialty yarns and weave types to produce a structure with advanced ballistic performance.

Style	Weave	Warp Count	Warp Yarn	Fill Yarn	Weight (oz/y)	Thickness (mils)	Strength (lb/in)	Warp	Fill
					(gsm)	(mm)			
420	Proprietary	28	28	Proprietary	4.0	136	7.6	0.19	700

*Kevlar Tracer

The physical properties listed are for greige (untreated) fabrics. Actual values may vary. JPSCM strongly recommends designers and users perform testing for application and package specific conditions. For additional information, please contact a Technical Service Representative, (864) 224-3506

Carbon Fabrics

JPS Composite Materials now offers a full line of carbon fabrics, available with a wide variety of yarn types and weights. We have invested in the production of carbon fabrics using the latest new weaving technologies. With the addition of our new carbon fabrics division JPS offers the most complete lineup of composite reinforcement fabrics in the industry.

We offer a variety of PAN based carbon fabrics utilizing 3k, 4k, 6k, and 12k carbon fibers. Our carbon fabrics are manufactured in a dedicated, FOD controlled, state-of-the-art facility located on our Statesville, NC campus.

JPS carbon fabric can be used for a wide variety of applications, including and primary and secondary aerospace structures, for high performance and recreational composites, as well as in ducting, tooling, and cosmetic applications.

We invite you to consider using carbon fabrics from JPS for your application. See first hand why we are considered the leader when it comes to high performance, precision engineered composite reinforcement materials.

For more information about our carbon fabrics, or to tailor a fabric to suit your application, please contact us at:

**1-800-431-1110

US to SI

$$1 \text{ oz/yd}^2 = 33.91 \text{ g/m}^2$$

$$1 \text{ oz} = 28.35 \text{ g}$$

$$1 \text{ lb} = 16 \text{ oz}$$

$$1 \text{ lb} = 0.454 \text{ kg}$$

$$1 \text{ N} = 0.102 \text{ kgf}$$

$$1 \text{ lbf} = 4.45 \text{ N}$$

$$1 \text{ psi} = 6894.76 \text{ Pa}$$

$$1 \text{ denier} = 0.111 \text{ Tex}$$

$${}^{\circ}\text{F} = ({}^{\circ}\text{C}) * (9/5) + 32$$

$$1 \text{ in} = 25.4 \text{ mm} = 2.54 \text{ cm}$$

$$1 \text{ lb/ft}^2 = 4.88 \text{ kg/m}^2$$

$$1 \text{ lb/ft}^3 = 16.02 \text{ kg/m}^3$$

$$1 \text{ yd} = 0.91 \text{ m}$$

$$1 \text{ ft} = 0.3048 \text{ m}$$

$$1 \text{ w.m}^{-1}. \text{k}^{-1} = 0.86 \text{ kcal.m}^{-1}. \text{h}^{-1}. \text{k}^{-1} = 6.9 \text{ btu.in}/(\text{ft.hr.}{}^{\circ}\text{F})$$

SI to US

$$1 \text{ g/m}^2 = 0.0295 \text{ oz/yd}^2$$

$$1 \text{ g} = 0.035 \text{ oz}$$

$$1 \text{ kg} = 2.205 \text{ lb}$$

$$1 \text{ kgf} = 9.81 \text{ N}$$

$$1 \text{ ksi} = 6.89 \text{ MPa}$$

$$1 \text{ MPa} = 1 \text{ N/mm}^2$$

$$1 \text{ GPa} = 1000 \text{ MPa}$$

$$1 \text{ Tex} = 9 \text{ denier}$$

$$1 \text{ Tex} = 496,052 \text{ yds/lbs}$$

$${}^{\circ}\text{C} = ({}^{\circ}\text{F}-32) * (5/9)$$

$$1 \text{ cm} = 0.39 \text{ in}$$

$$1 \text{ kg/m}^2 = 0.205 \text{ lb/ft}^2$$

$$1 \text{ kg/m}^3 = 0.062 \text{ lb/ft}^3$$

$$1 \text{ m} = 1.09 \text{ yd}$$

$$1 \text{ m} = 3.281 \text{ ft}$$

Metric Conversion Chart

Fabric	US	Factor	Metric
Length	yd	x 0.914	= m
Width	in	x 2.540	= cm
Weight	oz/yd ²	x 33.906	= g/m ²
Breaking Strength	lb/in	x 1.7513	= N/cm
Thickness	in	x 25.400	= mm
Mullen Burst	lb/in ²	x 0.007	= MPa
Air Permeability	cfm	x 0.508	= cm/cm ²
Area	yd ²	x 0.8361	= m ²
